The iniB, iniA and iniC GENES OF MYCOBACTERIA AND METHODS OF USE

Abstract of the Disclosure

This invention relates to the identification, cloning, sequencing and characterization of the iniB, iniA and iniC genes of mycobacteria which are induced by a broad class of antibiotics that act by inhibiting cell wall biosynthesis, including the first line antituberculosis agents, isoniazid and ethambutol. The present invention provides purified and isolated iniB, iniA, iniC and iniB promoter nucleic acids which may comprise the iniBAC operon, as well as mutated forms of these nucleic acids. The present invention also provides one or more single-stranded nucleic acid probes which specifically hybridize to the iniB, iniA, iniC and iniB promoter nucleic acids, and mixtures thereof, which may be formulated in kits, and used in the diagnosis of drug-resistant mycobacterial strain. The present invention also provides methods for the screening and identification of drugs effective against *Mycobacterium tuberculosis* using induction of the iniB promoter.
